SNOW MELTING CONTROL #650

This is a manually activated snow melting control. The 650 control uses a slab sensor #072 and outdoor air sensor #070 included with control to maintain a snow melt slab at a set surface temperature during snow melting. When melting system is not required, either the melting system is shut down, or the slab can be maintained at an idling temperature for faster response and improved safety. The built-in timer can be programmed to operate the snowmelt system for a set time period to help control energy costs.

This control can be used with the snow switch part number 4019 to automatically start the system.

ELECTRONIC CONTROLLER #665 & #664

ELECTRONIC CONTROLLER #665 – Used with snow/ice detector – The control will automatically turn on and off the snow melting system.

The 665 uses a signal from the snow/ice detector & outdoor air sensor (#070 included with control). Based on outdoor temperatures and detection from snow/ice detector, system is automatically turned on to maintain a snow melt slab at a set surface temperature during snow melting. When melting system is not required, due to warm temperatures or the snow/ice detector does not require melting, the system is automatically turned off. An ideal mode is a feature of this control that will maintain the slab at minimal temperatures for faster response and improved safety.

#664 – Is designed to control up to two zones in a snow melting system.

The control automatically adjusts the mixed supply water to the snow melting system by controlling up to two boilers and a single mixing device. For mixing, the 664 can use a variable speed injection pump, a floating action mixing valve or a 4-20 mA device when used with snow/ice detector.

Additional features include: Optional priority zoning; Slab protection; Boiler protection; Manual override; Warm Weather Shut Down; Cold Weather Shut Down; Pump & Valve exercising.

SNOW SWITCH #4019

Application

For use in residential and light commercial applications. Senses both temperature and precipitation. Its internal contacts can be used to trigger low voltages such as zone valves, pump relays, or boiler controls. A single floating electro-mechanical relay with a five amp rating is provided for control purposes. System continues to operate for 5 hours after precipitation stops to insure effective snow melting.

SNOW/ICE SENSOR #090 & #091

This is a commercial grade sensor that sits flush with the surface and will automatically activate the snow melting system should either snow or ice start to accumulate. The sensor knows when to activate and stop the snow melting system. The sensor must be used with a tekmar snow melting control.
